

!! READ INSTRUCTIONS BEFORE CUTTING ANY WIRES !!

The OTB-POL-INJ-09-14 and OTB-POL-INJ-16-T is intended to repair and upgrade broken fuel injector wires at the connector. The problem with the current Polaris wiring is that it is too short and vibration takes its toll on the wiring. This combination causes the wires to fail where they enter the connector after a very short period of time. The product you are installing not only lengthens the wire but the wires used in this product are vibration resistant wires that have more strands and a thick insulation to help support the wire.

Tools Required:

1. Wire cutters
2. Wire strippers
3. 18-22 AWG crimping pliers
4. Heat gun or hair dryer
5. Common Hand Tools

Installation Instructions:

1. Disassemble vehicle to gain access to the fuel injector connector. Consult a service manual for your vehicle if you are unsure of how to perform this step.
2. Unplug the fuel injector connector from the fuel injector by pressing down on the tab and pulling on the connector.
3. The back side of the 2 pin connector you disconnected in step 2 has small position numbers 1-2 on the right side of the wires where they attach to the connector. Position 1 is closest to the release tab. Write down the wire colors for each number. **This is a very crucial step.** If your wires are broken off and you don't know the wire colors please visit <https://otbpowersports.com> and visit the help forum and we have a factory wire color chart listed.

Position 1 Wire Color is _____

Position 2 Wire Color is _____

4. Now that you have written down all the existing wire colors. Take the wire cutters and cut each wire from the connector.
5. Remove approximately one quarter inch of insulation from each wire.

6. Connect each wire from the chart in step 3 one at a time. Use the 18-22 AWG crimping pliers and crimp each wire.
 - a. Position 1 wire color you wrote down goes to RED.
 - b. Position 2 wire color you wrote down goes to BLACK.
7. Take the Heat gun or hair dryer and heat up the 2 connections that you made. The appropriate amount of heat has been applied when you see the glue coming out the back of each splice. Your splices should look like the wires that are already attached to the harness.
8. Slide the black heat shrink tubing over the entire repair and use the heat gun to shrink the tubing over the whole splice.
9. Plug in the new connector and make sure the wire harness does not have any sharp kinks or bends and is out of the way from moving and hot components such as the exhaust and driveshafts. Also ensure that the wire has room to move and is not pulled tight.
10. Reassemble Vehicle.
11. Start vehicle and verify operation and drivability.
12. Enjoy not having to worry about repairing this connection again.
